Abstract

This invention is an adjustable hair roller. It is possible to make it large or small (diameter wise for bigger or smaller curls). Contrary to the existent rollers in the market that are non adjustable in diameter.

This invention is an adjustable hair roller. It is possible to make it large or small (diameter wise for bigger or smaller curls). Contrary to the existent rollers in the market that are non adjustable in diameter.

There are rows of holes (each row is locating side to side width wise) and there are plugs at one end of the hair roller. The amount of the plugs is equal to the amount of the holes in each row. By snapping the plugs in the each row of holes, it is possible to make the hair roller bigger or smaller.

The roller could be made of metal or plastic or plastic derivative . The surface of the roller which is in touch with hair could be covered by velcro or fabric or any self gripping material.

This invention enables the consumers to have different looks by adjusting the roller for bigger or smaller curls and many people in the household can benefit the same set of hair rollers by snapping the plugs into the holes, so it does not matter if some body has short or long hair, and consumers can use the same rollers while growing their hair or cutting their long tresses short.

Because it does the job of 3 or 4 rollers, it would take less storage space as well.
